

Pf-2903/nec/us/mh

ABSTRACT OF THE DISCLOSURE

A method or a processor for filtering process for attenuation to a
 5 frequency component in a designated frequency band of a frequency of
 variation of a dynamic image by detecting the moving object ; and
 subjecting at least a part of the moving object to a modified filtering
 process with at least a reduced attenuation or without attenuation and also
 subjecting a remaining part of the moving object to a normal filtering
 10 process with a non-reduced attenuation which is larger in magnitude than
 the reduced attenuation.
